Ecofiltro Water Filters at Nell Gwynn

Dear Parents/Carers,

We are now using Ecofiltro water filters in our classrooms to naturally filter the water children are drinking. I have attached a photo for you to see what the Ecofiltro looks like.

Children have been learning how to fill a cup independently by turning the lever on the small tap. We would prefer children drink the water provided at school rather than bringing in their own bottles of water, due to space for storage and bottles potentially getting mixed up if not labelled.

Ecofiltro's filter consists of three 100% natural materials: clay, activated carbon, and colloidal silver. This unique combination enables the removal and reduction of the majority of potential contaminants from the water while preserving essential minerals necessary for your health. The main contaminants removed by Ecofiltro include:

- Parasites
- Bacteria (including E. coli)
- Pesticides
- Microplastics

Additionally, Ecofiltro effectively reduces the following pollutants by a very high percentage:

- Volatile organic compounds
- Lime
- Iron
- Aluminum
- Lead
- Fluoride
- Arsenic
- Chlorine

We hope you find this information useful.
